

Appian's Agility Layer Extends the Value of Your Application Environment

The fastest way to unify data and processes across your enterprise.

The challenge of relying on legacy systems.

Government agencies around the world struggle with legacy systems that stand in the way of desperately needed modernization programs. Such enterprise legacy systems can look like large-scale enterprise resource planning (ERP) implementations or custom-built applications with complex codebases. These systems are difficult to support and upgrade, and don't provide the rich, intuitive experience today's users expect.

Additionally, many legacy systems have been highly customized to conform to business processes. As a result, the modified systems can no longer be updated with the latest versions of their own software.

Modernize your systems with high flexibility and low risk.

The Appian Platform serves as an "agility layer" that seamlessly bridges the gap between old and new systems. By connecting all the systems in your environment, Appian empowers your organization to build flexible applications and integrate to extend the life of your systems.

Appian keeps the workflow separate from the data, with the ability to link between them at any point:

- **Intelligent, end-to-end process automation** connects your people, systems, bots, AI, and business rules with a flexible low-code design experience.
- Appian's **data fabric** unifies data sources across your enterprise without the need to replicate or move data. It enables workflow elements to access consistent, accurate, and compliant data at any point in the process.

Appian applications are easy to update as your organization adapts to new requirements or as regulations change.

Appian accelerates process and system modernization by enabling you to:

- Build workflows 10x faster than with traditional coding and update them in real time—all in the FedRAMP-certified, IL4/5-compliant Appian Cloud.
- Automate processes to execute faster while freeing employees from repetitive, error-prone, mundane tasks.
- Easily integrate with both new technologies and legacy systems without the need for APIs.
- View all relevant data in a unified dashboard, eliminating the need for "swivel chairing" between multiple systems.

200+ government agencies leverage Appian to modernize mission-critical systems and applications.

Customer case study:

Office of the Comptroller of the Currency

The Office of the Comptroller of the Currency (OCC) modernized their Central Application Tracking System (CATS) that affects roughly 160,000 institutions across the US. Using Appian, they improved the efficiency, security, and flexibility of licensing processes for all US national banks with a single view across multiple systems.

Accelerate your IT modernization journey to expedite your mission.
